

SQLJSON

I. User Authentication and Authorization.

New registration will also create a new workgroup. By default you will have a "DIRECTOR" roles of the group.

You can add a new user to your workgroup, and customize the user roles of your workgroup. To manages Workgroup and Authoziation, you need to have a "ADMINISTRATOR" role, and by default you will have it on your new application.

1. Workgroup.

II. Create New Backend Service.

Create Project.

1. After Login, go to dashboard <https://app.ardvro.com>. Then click Projects.

2. Create "plus" button to create new project.

3. Input the project information, then click Save button.

Project Type:

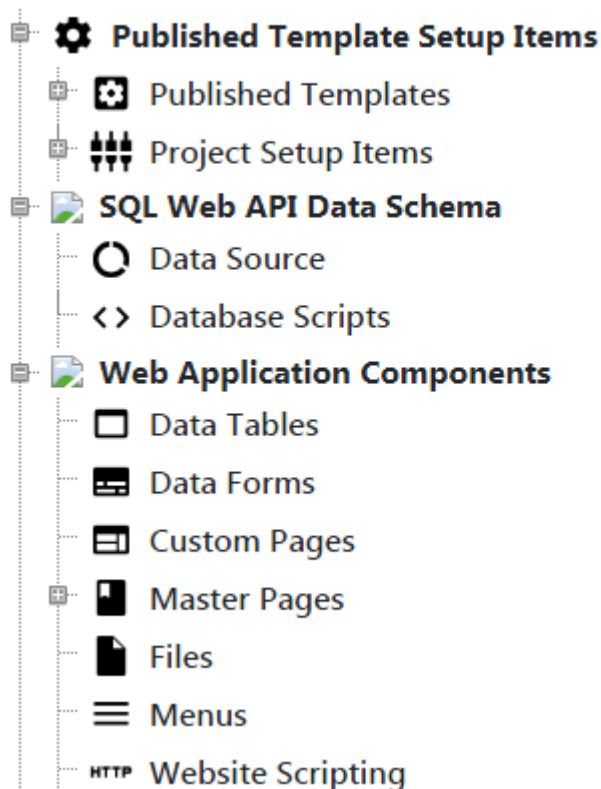

Public -> You can share your project to others.

Private -> Only your workgroups members can access the project.

Hosting Type: You have to Select "AppHosting".

4. After you saved, the project items will be appear.

Project Items: ?

- a. Published Template Setup Items.
 - i. Published Template.

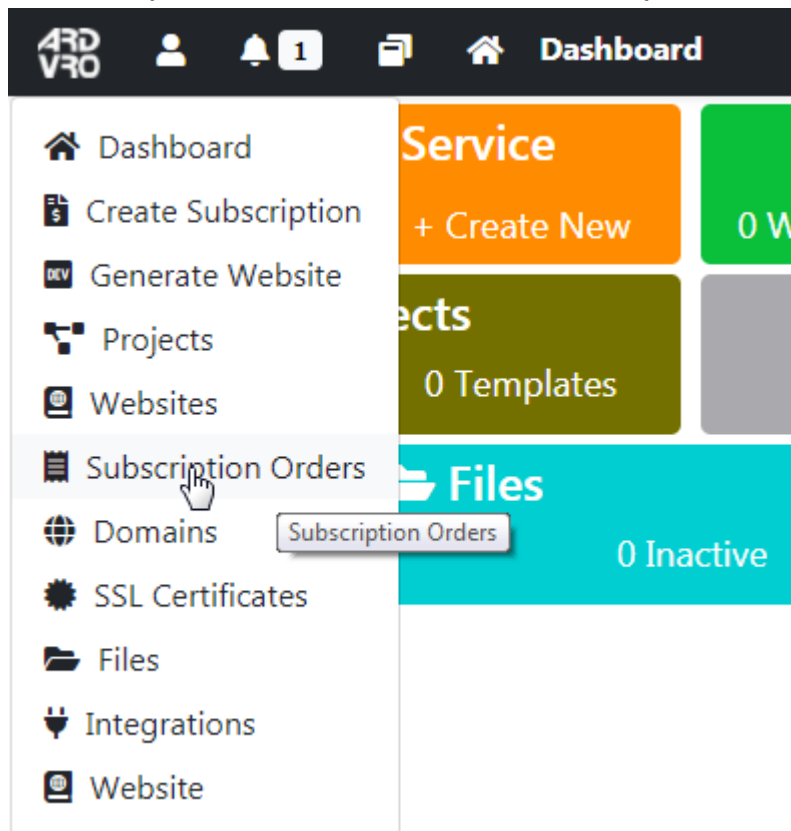

1. You can create an application template.
 2. If you set public the others member can use your template.
- ii. Project Setup Items.
 1. Setting that can be input by the users.
 2. You can set the any input variables, rules and type.
- b. SQL Web API Data Schema.
 - i. Data Source.
 1. Table. You can create a database table, create on the Data source tree to create new. After you click save, refresh the Tree, then the new item named Data Source Item will appear under your table name.
 - a. Data Source Item (table columns). You need to defined the columns. To create the columns of the table click on the Data Source Item node.
 - b. Data Source Roles. You can define what type of roles that has the access right to the table of each of CRUD operation.
 2. Procedure. You can create a database store procedure, create on the Data source tree to create new. On the content, type the SQL Store procedure code.
 - a. Data Source Item (Store procedure arguments). You need to defined the columns. To create the columns of the table click on the Data Source Item node.
 - b. Data Source Roles. You can define what type of roles that has the access right to the access the Store Procedure.
 - ii. Database script.

You can use any database query when deploying a project. When you deploy a project, a new database will be created, and all Database script will be executed in the database. You can write table, store procedure, Initinial on this item. But if you create table and procedure in this item, you need to define the access roles later after your project have been deployed.

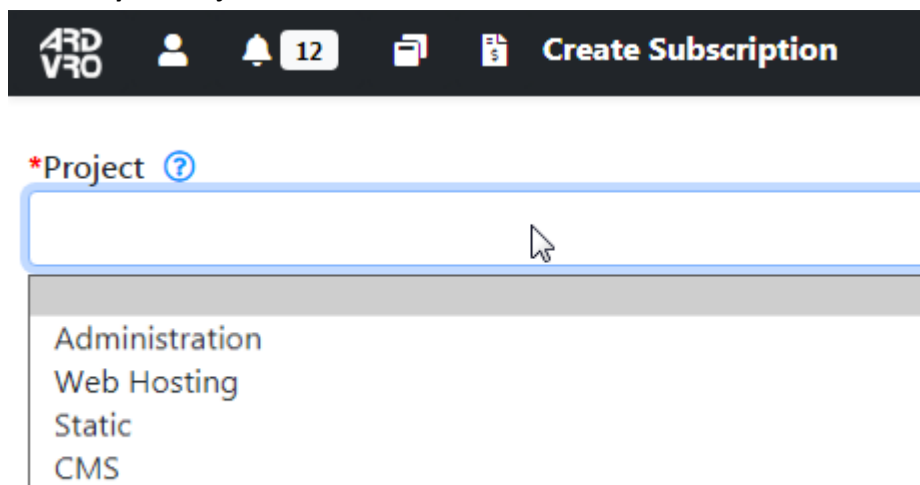

III. Publish Project.

You can modify your project, tables, store procedures, roles. If you modify your project you need to redeploy your project.

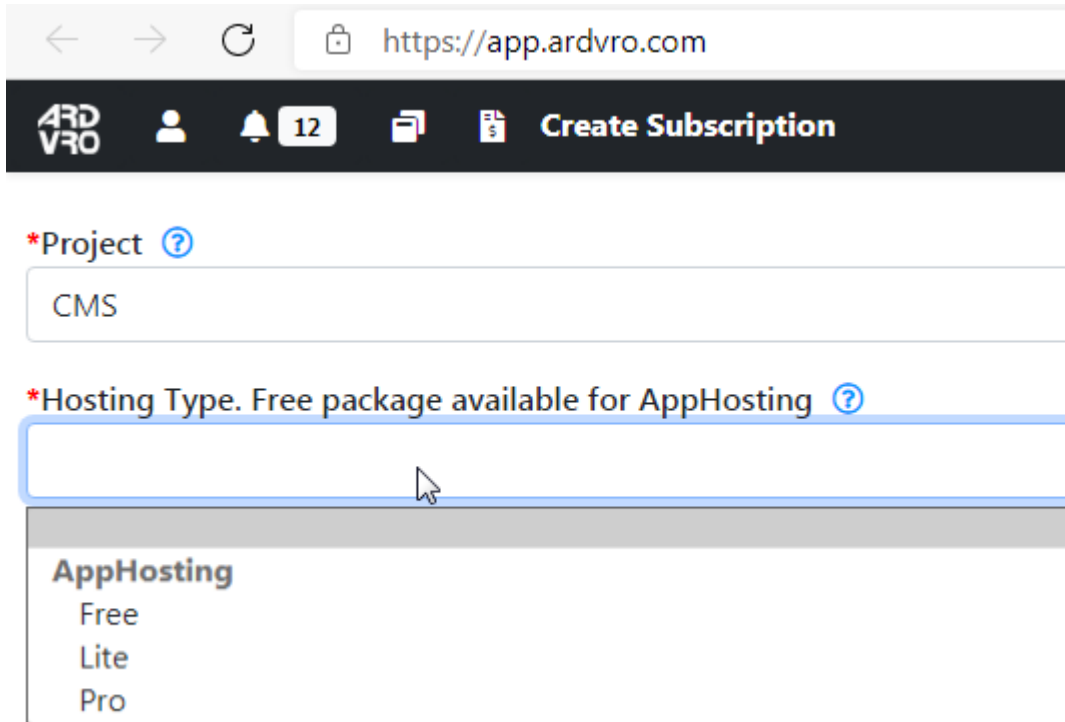

1. On the top left menu button, Click "Create Subscription" on the menu.

2. Select your Project.

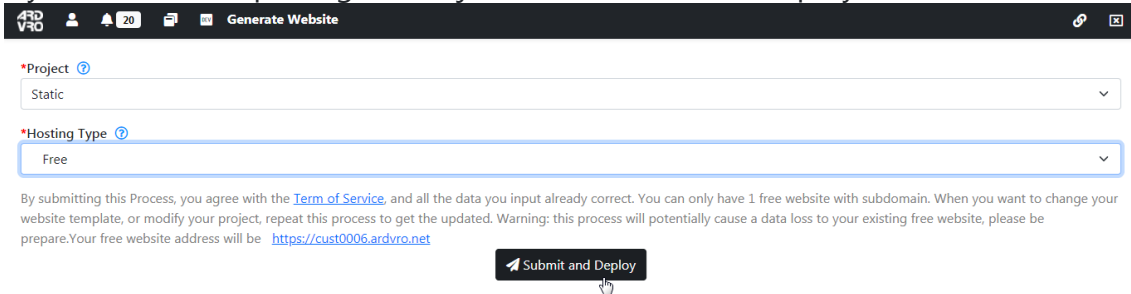

3. Select your hosting package options.

The screenshot shows the web interface of <https://app.ardvro.com>. The top navigation bar includes the ARDVRO logo, a user profile icon, a notification bell with '12', a document icon, a dollar sign icon, and a 'Create Subscription' button. Below the navigation bar, there is a form with two main sections:

- *Project** (with a help icon): A text input field containing the value 'CMS'.
- *Hosting Type. Free package available for AppHosting** (with a help icon): A dropdown menu that is currently open, showing three options: 'AppHosting', 'Free', 'Lite', and 'Pro'. A mouse cursor is pointing at the 'AppHosting' option.

1. If you select FREE package, then just klik "Submit and Deploy".

This screenshot shows the 'Generate Website' form after the 'Free' package has been selected. The form includes:

- *Project** (with a help icon): A dropdown menu with 'Static' selected.
- *Hosting Type** (with a help icon): A dropdown menu with 'Free' selected.
- A warning message: "By submitting this Process, you agree with the [Term of Service](#), and all the data you input already correct. You can only have 1 free website with subdomain. When you want to change your website template, or modify your project, repeat this process to get the updated. Warning: this process will potentially cause a data loss to your existing free website, please be prepare. Your free website address will be <https://cust0006.ardvro.net>"
- A 'Submit and Deploy' button with a right-pointing arrow icon.

2. If you select Lite Package, then fill your domain, subscription duration, and voucher code if you have. We highly recommended this options for non-IT background Note new domain will take approximately upto 48 hours to be redirected to ARDVRO Server, as well as existing or transfered domain. You can manage the domain on the Domain menu in the Dashboard <https://app.ardvro.com>. The domain will remain yours as long as you pay the registration fee to the Domain registrar, can be through us or others.

V. Javascript Client SDK.

The Javascript Client SDK work with Event Driven Programming and fully asynchronous.

1. Initialize Connection.

Basic Initialization.

Put on head of index.html

```
13 <script type="text/javascript" src="https://app.ardvro.com/res/js/production/app.res.js.production.js"></script>
14 <script type="text/javascript" src="https://cdn.ardvro.com/ardvro/ardvro.js"></script>
15 <script type="text/javascript">
16   const WEBSOCKETURL = "ardvro.com";
17   const WEBBASEURL = "https://app.ardvro.com";
18   const CDNURL = "https://cdn.ardvro.com";
19   window.onload = function ()
20   {
21     Loader.Start(listeners);
22   };
23   (function ()
24   {
25     Loader.InitDependencies(WEBBASEURL, CDNURL, dependencies);
26   })();
27 </script>
```

```
<script type="text/javascript"
src="https://[DOMAINNAME]/res/js/production/app.res.js.production.js"></script>
<script type="text/javascript"
src="https://cdn.ardvro.com/ardvro/ardvro.js"></script>
<script type="text/javascript">
  const WEBSOCKETURL = "ardvro.com";
  const WEBBASEURL = "https://[DOMAINNAME]";
  const CDNURL = "https://cdn.ardvro.com";
  window.onload = function ()
  {
    Loader.Start(listeners);
  };
  (function ()
  {
    Loader.InitDependencies(WEBBASEURL, CDNURL, dependencies);
  })();
</script>
```

Custom initialization.

You can create any custom initialization logic, but you need to call `Loader.Start(...)` first. You can also customize the dependencies.

Example custom Initialization:

```

<script type="text/javascript" src="https://www.ardvro.com/res/config/PageConfig.js"></script>
<script type="text/javascript" src="https://www.ardvro.com/res/config/WebsiteConfig.js"></script>
<script type="text/javascript" src="https://www.ardvro.com/res/config/WebsiteSetting.js"></script>
<script type="text/javascript" src="https://www.ardvro.com/res/js/CommonUtils.js"></script>
<script type="text/javascript" src="https://www.ardvro.com/res/js/Lang_ID.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/ardvro.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/component/netcorehost/model/ardvro.component.netcorehost.model.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/component/netcorehost/controller/ardvro.component.netcorehost.controller.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/component/netcorehost/view/ardvro.component.netcorehost.view.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/plugin/cms/res/config/ardvro.plugin.cms.res.config.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/plugin/cms/res/js/production/ardvro.plugin.cms.res.js.production.js"></script>
<script type="text/javascript" src="https://cdn.ardvro.com/ardvro/plugin/cms/ardvro.plugin.cms.js"></script>
<script type="text/javascript">
    const WEBSOCKETURL = "ardvro.com";
    const WEBBASEURL = "https://www.ardvro.com";
    const CDNURL = "https://cdn.ardvro.com";
    window.onload = function ()
    {
        Loader.Start(listeners,
            function (startup)
            {
                Cms.InitMenu(startup);
            },
            function (usr, startup)
            {
                Cms.InitMenu(startup, usr);
            }
        );
    };
    (function ()
    {
        Loader.InitDependencies(WEBBASEURL, CDNURL, dependencies);
    })();
</script>

```

```

var Cms = (function ()
{
    let cms = {};

    let _profileController;
    let _contentController;

    let _profile = {};
    function getProfile()
    {
        return _profile;
    }
    function setProfile(profile)
    {
        _profile = profile;
    }

    cms.GetProfile = function ()
    {
        return getProfile();
    };

    cms.InitMenu = function (websiteStartuper, usr)
    {
        _profileController = new ProfileController({
            Connector: websiteStartuper.GetConnector(),
            GetServerTime: websiteStartuper.GetServerTimeFunction(),
            OnLoad: function (profileCtrl)
            {
                _contentController = new ContentController({
                    Connector: websiteStartuper.GetConnector(),
                    GetServerTime:
                        websiteStartuper.GetServerTimeFunction(),
                    OnLoad: function (ctrl)
                    {

```

```

        if (websiteStartuper.GetUser() != null && usr !=
null)
        {
            registerProfile(ctrl, profileCtrl,
websiteStartuper.GetUser(), websiteStartuper.GetAppName(),
websiteStartuper.GetServerTimeFunction(),
            function (profileResult)
            {
                reinitMenuItems(ctrl,
profileCtrl, websiteStartuper, profileResult);
                setProfile(profileResult);
            }
        );
    }
    else
    {
        reinitMenuItems(ctrl, profileCtrl,
websiteStartuper, {});

        let chatContentField =
Object.keys(websiteStartuper.GetWebsiteSetting()).find(x => x.includes(CONTENT_CHAT_ID));
        if (chatContentField != null)
        {
            let chatContentId =
websiteStartuper.GetWebsiteSetting()[chatContentField];
            if (chatContentId != null &&
!isNaN(chatContentId))
            {
                let wigChat = new

                Id: "chatWidget",
                Label: "Chat

                cmsContentId:

                CdnUrl:

                Theme:

                Connector:

                Authenticator:

                GetServerTime:

                AppName:

                NotificationListeners: websiteStartuper.GetNotificationListeners()
            });
            wigChat.Tonggle();
        }
    }
}
}
});
}
});
});

```

```
};
```

2. Initalized DB Context.

After Websocket connection establish, next it need to initialize the DBContext. The DBContext object will be retrived base on the Authorization configuration.

```
let dbcontext = new SqlJsn({ Connector: cfg.Connector });
```

3. Get Data.

```
dbcontext.Customer.Where("Name like (?) and status in (?)", name,
[1,2,3]).OrderBy("Name ASC").Limit(0, 10).PagingJsons("*").Send(function(results){ let list
= JSON.parse(results); });
```

4. Upsert.

```
let data = {};
data.Id = 0;
data.Status = 1;
data.Updated = cfg.GetServerTime().Format('yyyy-MM-dd HH:mm:ss');
data.Updater = "";
data.VoteType = voteType;
data.Value = voteValue;
data.pfeProfileId = profileId;
data.cmsContentId = contentId;

dbcontext.cmsContentVote.Save(data).Send(function (result)
{
    if (callback != null)
    {
        callback(result);
    }
});
```

5. Delete.

```
dbcontext.cmsContentVote.Delete(data).Send(function (result)
{
    if (callback != null)
    {
        callback(result);
    }
});
```

6. Call Store Procedure.

```
dbcontext.sp_cmsContentTags.ProcedureJsons(pageIndex, rows,
orderMode).Send(function (jsons)
{
    if (callback != null)
    {
        let list = [];
        if (jsons != null && jsons != "")
        {
            list = JSON.parse(jsons);
        }
        callback(list);
    }
});
```

7. More example, visit: <https://github.com/ardvro>
